

My project idea

A simple **Digital Business Card Generator** where the user types their details into a form and the card updates live on the screen. They can change colours and styles, and the preview changes instantly using JavaScript.

One feature I will build:

A **live preview** that updates as the user types (name, job title, colours).

One thing I need to research:

How similar “business card generator” apps work, especially how they update the preview when the user changes the inputs.

Features (3):

1. **Live Card Preview** – the business card updates instantly as the user types.
2. **Style Customization** – users can change colors, fonts, and layout styles.
3. **Social Icons Toggle** – users can turn social icons on/off depending on what they want on the card.

Similar Websites (2):

1. **Canva Business Card Maker** – lets users design cards with live editing and style options.
2. **Adobe Express Card Creator** – simple online tool for creating personalized business cards.
